The invention relates to an anchoring system to hold a vessel anchored during loading or unloading that comprises one or more anchor lines, extending upwards from one or more anchor to a subsea buoy, where a slack is arranged in the anchor lines by one or more clump weights. In claim 1 it is mentioned that the buoyancy of the subsea buoy and the buoyancy of the surface buoy is adapted such that by damage on the surface buoy, or the line therefrom to the subsea buoy, the subsea buoy and thereto suspended equipment will not be lowered further down vertically than that one or more of the clump weights are landing on the seabed, while during loading or unloading will at least one of the clump weights on each anchor line be located on or just above the seabed. This makes it unobvious to a person skilled in the art to modify the floating transfer station in D1 in such a way that the claimed invention according to the first claim is obtained.

The cited documents represent the general state of the art and the invention defined in claims 1- 8 is not disclosed by any of these documents.

Accordingly, the invention defined in claims 1- 8 is novel and is considered to involve an inventive step. The invention is industrially applicable.
